JC18 Rec'd PCT/PTO 22 MAY 2001

TITLE OF THE INVENTION

PRONUNCIATION JUDGEMENT SYSTEM

CROSS-REFERENCE TO RELATED APPLICATIONS

This is a Continuation Application of PCT  
5 Application No. PCT/JP99/05257, filed September 27,  
1999, which was not published under PCT Article 21(2)  
in English.

BACKGROUND OF THE INVENTION

The present invention relates to a pronunciation  
10 judgment system using a voice recognition function for  
language pronunciation practice of foreign language or  
the like including especially English conversation, and  
a recording medium for storing a computer program  
thereof.

15 Conventionally, a number of language learning  
systems for practicing English conversation or the  
like have been developed. A typical system is an  
interaction with a computer. Here, the computer  
becomes one speaker, displays the face of a collocutor  
20 on the screen, and asks questions to which a user  
responds. This user response voice is input to the  
computer and recognized. Then, when it agrees with  
the correct answer contents, a person representing the  
collocutor on the screen nods, or other predetermined  
25 display is executed, it proceeds to the next question  
in a way to continue the conversation.

However, this system requires to examine also

the content of the response; hence the system is not appropriate for a simple pronunciation repeat practice. In short, when the response content is not correct, the conversation does not continue, in this case, the user can not determine whether the content itself was wrong or his/her pronunciation was wrong. In addition, the user can not concentrate his/her attention to the pronunciation practice, worrying about giving a correct answer. Further, the agreement with the correct answer content is determined by the comparison with a single kind of reference voice data representing the answer content and the determination is fixed; therefore, when the content agrees and only the pronunciation disagrees, the user can not know how wrong was his/her pronunciation and, hence, can not realize to which extent his/her pronunciation is understood by a foreigner. In addition, if the reference voice data level is too high, the user can not pass although he/she tries many times, losing possibly his/her motivation.

It is an object of the present invention is to provide a pronunciation judgment system allowing to know objectively to what extent one's pronunciation is recognized by the collocutor, and a recording medium for storing a computer program thereof.

Another object of the present invention to provide a pronunciation judgment system allowing to practice

the pronunciation effectively through a repeated  
pronunciation practice of the same text, and display  
of the degree of similarity to the reference  
pronunciation, each time, and a recording medium  
5 for storing a computer program thereof.

#### BRIEF SUMMARY OF THE INVENTION

The pronunciation judgment system of the present  
invention comprises a database for storing reference  
pronunciation data, reference voice playback means for  
10 outputting the reference voice based on the reference  
pronunciation data, similarity determination means  
for comparing a user pronunciation data input in  
correspondence to the reference voice and the reference  
pronunciation data, and means for informing the user of  
15 the agreement, if the similarity determination means  
judges the agreement of both data.

In a preferred embodiment, the database may store  
a plurality of reference pronunciation data correspond-  
ing to the pronunciation fluency level, for the same  
20 language. The reference voice playback means may  
include a user operation member for selecting the level  
and output the selected level reference voice, until  
the informing means informs the user the agreement of  
both data. The database may store reference pronuncia-  
25 tion data of a plurality of level for each of a number  
of sentences, while the reference voice playback means  
may include a user operation member for selecting

sentences and the level and output the selected level  
reference voice of the selected sentence, until the  
informing means informs the user the agreement of both  
data. It may further include means for displaying a  
5 sentence corresponding to the reference pronunciation  
data.

The computer readable recording medium for  
recording a program to be executed by a computer of  
the present invention records a computer program for  
10 executing by a computer steps of reading out the  
reference voice data from the database, playing back  
reference voice based on the read out reference voice  
data, judging the similarity by comparing the user  
pronunciation data input in correspondence to the  
15 reference voice data and the reference voice data,  
and informing the user of the agreement of both data  
if such agreement is determined by the similarity  
determination step.

In a preferred embodiment, the database may store  
20 a plurality of reference pronunciation data correspond-  
ing to the pronunciation fluency level, for the same  
language. The reference voice playback step may output  
the user selected level reference voice, until the  
informing step informs the user of the agreement of  
25 both data. The database may store reference  
pronunciation data of a plurality of level for each of  
a number of sentences, while the reference voice

5 playback step may output the user selected level  
reference voice of the user selected sentence, until  
the informing step informs the user of the agreement  
of both data. The program may execute a step of  
displaying a sentence corresponding to the reference  
pronunciation data by the computer.

10 The present invention allows to judge if one's  
pronunciation attains the level to be recognized by  
the collocutor, and improve the language learning  
(pronunciation learning) efficiency, by repeating this  
practice.

15 Additional objects and advantages of the invention  
will be set forth in the description which follows, and  
in part will be obvious from the description, or may  
be learned by practice of the invention. The objects  
and advantages of the invention may be realized and  
obtained by means of the instrumentalities and  
combinations particularly pointed out hereinafter.

#### BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING

20 The accompanying drawings, which are incorporated  
in and constitute a part of the specification,  
illustrate presently preferred embodiments of the  
invention, and together with the general description  
given above and the detailed description of the  
25 preferred embodiments given below, serve to explain  
the principles of the invention.

FIG. 1 is a block diagram showing a configuration

of the pronunciation judgment system according to the present invention;

FIG. 2 is a flow chart showing the flow during the pronunciation practice according to the present invention; and

FIG. 3 shows an example of lesson screen.

#### DETAILED DESCRIPTION OF THE INVENTION

Now, the embodiment of pronunciation judgment system of the present invention will be described.

FIG. 1 is a block diagram showing a configuration of the whole system. A CPU 10, a CD-ROM drive 12 are connected to a system bus 14. This system is realized by executing a computer program stored in the CD-ROM drive 12 by the CPU 10. A database 16 for storing reference pronunciation data serving as model of pronunciation practice, for the respective beginner's, intermediate and advanced levels and a level selection unit 18 for selecting the level of the database 16 are also connected to the system bus 14. The database 16 is constructed by collecting pronunciation signal (waveform signal) of a great number of individuals (several hundreds of thousand) and averaging pronunciation data of spectrum analysis thereof. Here, the database 16 is included in the pronunciation practice program, and it may be contained in a CD-ROM and taken in the system, each time. The beginner's level corresponds to the pronunciation of a Japanese teacher

of English, the advanced level to the pronunciation of a fluent European and American speaker, and the intermediate level to the pronunciation of a European and American speaker who does not speak so fluently.

5 The database is not necessarily divided into three physical units, but it may only be divided functionally.

A microphone 20 for inputting the voice waveform pronounced by a user is connected to the system bus 10 14 through a voice recognition unit 22. The voice recognition unit 22 obtains the pronunciation data through spectrum analysis of input voice waveform. This voice recognition unit 22 should perform the same spectrum analysis as used for obtaining the pronunciation data of the database. A CRT 26 is connected to 15 the system bus 14 through a display controller 24, and a mouse 28 and a keyboard 30 are connected through an I/O 32 and, also, a speaker 36 is connected through a voice synthesis unit 34.

20 Now, the operation of the present embodiment will be described referring to the flow chart shown in FIG. 2. This flow chart shows the processing flow of computer program performed by the CPU 10 and stored in the CD-ROM 12. Upon starting the operation, a lesson 25 screen shown in FIG. 3 is displayed. This embodiment is supposed to be based on, for example, English textbook for junior high school, and be a pronunciation

practice system of texts included in the textbook.

The lesson screen comprises a lesson chapter display section 50, an image display section 52 related to the lesson chapter 52, a text display section 54, a pronunciation level display section 56, and a display section 58 showing the number of times of practice per text.

The lesson chapter display section 50 displays right and left triangular icons, allowing to select a lesson chapter by operating them with the mouse 28. The text display section 54 shows a plurality of texts, and a square icon showing the text selection state at the left of each text, and a heart mark icon showing a good pronunciation level determination result as the right are displayed. The heart mark icon is a success mark to be displayed a student can pronounce similarly to the model pronunciation (divided into three levels). The level display section 56 displays also the note (out of 10) for the respective level; however, this note is nothing but a standard for indicating the difficulty of respective levels. In the example of FIG. 3, the beginner's level is selected.

In step S10, the lesson chapter is selected. In step S12, the level is selected. The level is selected by selecting any level line with mouse. Here, the beginner's level is selected. In step S14, the text is selected. In the example of FIG. 3, the third "I am fine. And you?" is selected.

In step S16, the beginner's level reference pronunciation data of this selected text is read out from the database 16, the voice is synthesized at the voice synthesis unit 34 and output from the speaker 36 as model pronunciation. The model pronunciation may be output not only once but several times, and the output speed may be varied for several output.

In step S18, the user pronounces imitating this model voice. The user voice waveform is input into the voice recognition unit 22 through the microphone 20. The voice recognition unit 22 obtains the pronunciation data through the spectrum analysis of this voice signal.

In step S20, the user pronunciation data and the reference voice data stored in the database 16 are compared to obtain the similarity degree. The higher this similarity is, the closer the user pronunciation is to the reference voice, showing that the user speaks well, and one's pronunciation has a higher possibility to be communicated exactly to the collocutor and recognized correctly.

In step S22, it is determined whether this similarity is higher than a predetermined similarity, or whether this text pronunciation has obtained the passing mark and succeeded. If the passing mark is not obtained, it goes back to step S16, again, the same text reference voice is output from the speaker 36,

and the user repeats the pronunciation practice.

If one text is passed, in step S24, it is determined whether all texts of a chapter are passed or not. If there is any text that is not passed, it goes  
5 back to step S14, another text is selected, and the user repeats the pronunciation practice.

If all texts are passed, in step S26, it is determined whether all levels are passed. If there is any level that has not been passed, it goes back to  
10 step S12, another level is selected, and the user repeats the pronunciation practice for all texts of the concerned level.

If all levels are passed, in step S28, it is determined whether the other chapters are also passed.  
15 If there is any chapter that has not been passed, it goes back to step S10, another chapter is selected, and the user repeats the pronunciation practice for all texts, all levels of the concerned chapter.

As described above, in the present embodiment, the  
20 text is displayed and the reference voice is pronounced using a computer, while the student imitates this pronunciation and input from the microphone 20. Then, in the computer, the similarity between the reference voice data and the student input voice data  
25 is determined, and if the similarity is lower than a predetermined value, it makes the student repeat the pronunciation practice, and when it is becomes higher

than the predetermined value, a success mark is displayed. Thus, the pronunciation practice can be repeated as desired effectively, because the pronunciation practice can be repeated as desired for the same text, and pronunciation level determination result is displayed each time. In addition, the reference voice data is not limited to one kind, but three kinds including the beginner's level pronunciation data which is the pronunciation of a Japanese teacher, the advanced level pronunciation data which is the pronunciation of a particularly fluent native speaker, and the intermediate level pronunciation data which is the pronunciation of a foreign speaker who does not speak so fluently, thereby allowing to improve the pronunciation gradually from the beginner's level to the advanced level through the intermediate level, avoiding a case where the user can not succeed although he/she tries many times because the level is too high, and preventing him/her from losing the motivation.

The present invention is not limited to the embodiment mentioned above, but various modifications can be executed. For example, the essential configuration of the lesson screen has only to have the success mark and the other displays are arbitrary at all.

Further, in addition to displaying only the success mark, the similarity to the reference voice may be scored, even in case of failure. Here, the reference

pronunciation and the user pronunciation are conducted alternately; however, it is preferable to make the user pronounce at the same time as hearing the reference pronunciation. In the reference voice database, not  
5 average data of voice data of number of persons (data after spectrum analysis), but the voice wave form of a particular speaker can be stored as it is. In this case, the voice synthesis unit 34 at the front stage of the speaker 36 is not necessary. In place, it is  
10 necessary to submit the voice waveform signal read out from the database to the spectrum analysis by the voice recognition unit 22 as the user input voice signal from the microphone, and to compare with the user input voice data. The object of practice is not limited to  
15 English and may include Chinese or the like, and it is not limited to foreign languages, but may include Japanese (National language) or the like. In addition, the corresponding Japanese may be displayed at the same time under the English text display. Further, in place  
20 of providing database for respective three levels, but it may be so constructed to use a single database, allowing to change only the level. It will be enough to have the repeated practice effects for the present invention, and it is not always necessary to divide the  
25 reference pronunciation into a plurality of levels.

As mentioned above, the present invention allows to provide a pronunciation judgment system capable of

determining whether one's pronunciation is recognized  
by the collocutor, and a recording medium for storing  
a computer program thereof. In addition, the present  
invention can provide a pronunciation judgment system  
5 allowing to practice the pronunciation effectively  
through a repeated pronunciation practice of the same  
text, and to practice the pronunciation effectively  
alone until the a predetermined similarity level is  
obtained by comparing, each time, with the reference  
10 voice, determining whether it agrees with the reference  
and displaying how it resembles to the reference  
pronunciation, and a recording medium storing the  
a computer program thereof.

Additional advantages and modifications will  
15 readily occur to those skilled in the art. Therefore,  
the invention in its broader aspects is not limited to  
the specific details and representative embodiments  
shown and described herein. Accordingly, various  
modifications may be made without departing from the  
20 spirit or scope of the general inventive concept as  
defined by the appended claims and their equivalents.

WHAT IS CLAIMED IS:

1. A pronunciation judgment system comprising:  
a database for storing reference pronunciation  
data;

5       reference voice playback means for outputting a  
reference voice based on said reference pronunciation  
data;

      similarity determination means for comparing a  
user pronunciation data input in correspondence to said  
10       reference voice and said reference pronunciation data;  
and

      means for informing a user of a result of determi-  
nation made by said similarity determination means.

2. The pronunciation judgment system according to  
15       claim 1, wherein said database stores a plurality of  
reference pronunciation data corresponding to a  
pronunciation fluency level, for the same language.

3. The pronunciation judgment system according to  
claim 2, wherein said reference voice playback means  
20       includes a user operative member for selecting a level,  
and outputs a selected level reference voice, until  
said similarity determination means detects agreement  
of both data.

4. The pronunciation judgment system according  
25       to claim 1, wherein said database stores reference  
pronunciation data of a plurality of level for each  
of a number of sentences, and said reference voice

5 playback means includes a user operative member for selecting a sentence and a level and outputs a selected level reference voice of a selected sentence, until said similarity determination means detects agreement of both data.

5. The pronunciation judgment system according to claim 1, further comprising means for displaying a sentence corresponding to the reference pronunciation data.

10 6. The pronunciation judgment system according to claim 1, wherein said informing means informs of the agreement of both data.

15 7. A computer readable recording medium for storing a program for causing a computer to execute the steps of:

reading out reference voice data from a database;  
playing back a reference voice based on the read out reference voice data;

20 determining a similarity by comparing user pronunciation data input in correspondence to said reference voice data and said reference voice data; and informing a user of a result of determination made by said similarity determination step.

25 8. The recording medium according to claim 7, wherein said database stores a plurality of reference pronunciation data corresponding to a pronunciation fluency level, for the same language.

9. The recording medium according to claim 7,  
wherein said reference voice playback step outputs  
a user selected level reference voice, until said  
similarity determination step detects agreement of both  
5 data.

10. The recording medium according to claim 7,  
wherein said database stores reference pronunciation  
data of a plurality of levels for each of a number of  
sentences, and said reference voice playback step  
10 outputs a user selected level reference voice of a user  
selected sentence, until said similarity determination  
step detects agreement of both data.

11. The recording medium according to claim 7,  
wherein said program causes a computer to execute also  
15 a step for displaying a sentence corresponding to the  
reference pronunciation data.

12. The recording medium according to claim 7,  
wherein said informing step informs of agreement of  
both data.

Database stores reference voice data for beginner's, intermediate and advance levels. Text in lesson screen displayed on CRT is selected, reference voice data corresponding to this text is read out and model pronunciation is generated. User listens to this, and imitates pronunciation. Computer obtains voice data through the spectrum analysis of the user voice by voice recognition unit and determines user pronunciation level. Predetermined success mark is displayed on screen, if user pronunciation is so good that it is communicated exactly to collocutor. If determination result is bad, practice is repeated for the same text many times. This allows user to judge if his/her pronunciation is recognized by foreigner and improve foreign language pronunciation learning effect, by repeating this practice.

Database stores reference voice data for beginner's, intermediate and advance levels. DECLARATION FOR PATENT APPLICATION

As a below named inventor, I declare that my residence, mailing address and citizenship are as stated below above my name; I believe that I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

PRONUNCIATION JUDGEMENT SYSTEM

the specification of which is attached hereto.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. 119(a)-(d) or 365(b) of any foreign application(s) for patent or inventor's certificate, or 35 U.S.C. 365(a) of any PCT International application which designated at least one country other than the United States, listed below and have also identified below any foreign application for patent or inventor's certificate, or PCT International application having a filing date before that of the application on which priority is claimed:

None

I hereby claim the benefit under 35 U.S.C. 120 of any United States application(s) or 35 U.S.C. 365(c) of any PCT International application designating the United States, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application or PCT International application in the manner provided by the first paragraph of 35 U.S.C. 112, I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR 1.56, which became available between the filing date of the prior application and the national or PCT international filing date of this application.

International Application PCT/JP99/05257, filed September 27, 1999

I hereby appoint as my attorneys, with full power of substitution and revocation, to prosecute this application and transact all business in the Patent and Trademark Office connected therewith: Henry A. Marzullo, Jr. (Reg. No. 20,910), Howard N. Aronson (Reg. No. 27,302) and Myron Greenspan (Reg. No. 25,680), each of whose address is Lackenbach Siegel Buliding, One Chase Road, Scarsdale, N.Y. 10583, or any one of them, and request that correspondence be directed to Lackenbach Siegel Marzullo Aronson & Greenspan, P.C., Lackenbach Siegel Building, One Chase Road, Scarsdale, N.Y. 10583. 3

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
